

Curriculum Errata Notice

2024 Level II CFA Program

UPDATED 27 August 2025

This document outlines the errors submitted to CFA Institute that have been corrected.

Due to the nature of our publishing process, we may not be able to correct errors submitted after 1 September 2024 in time for the publication of the following year's print materials. However, we update all errors in the Learning Ecosystem (LES) and in this document at the end of each month.

We recommend checking either the LES or this document regularly for the most current information. Depending on when you purchase the print materials, they may or may not have the errors corrected.

All errors can be submitted via <https://cfainst.is/errata>

Quantitative Methods

Basics of Multiple Regression and Underlying Assumptions

| Lesson | Location | PDF Pg | Revised | Correction |
|---|---------------------------------|--------|----------------|--|
| Basics of Multiple Regression | Knowledge Check - Solution to 1 | 9 | 29 Jan 2024 | <p>Replace: If the market excess return, SMB, and HML are each zero, then we expect a return on the portfolio of 1.534%.</p> <p>With: If the market excess return, SMB, and HML are each zero, then we expect a return on the portfolio of 1.5324%.</p> |
| Assumptions Underlying Multiple Linear Regression | Knowledge Check- Solution to 3 | 9 | 25 August 2025 | <p>Replace: $R = 1.534 + 0.5892(1) - 0.8719(4) - 0.0560(-2) = -1.2524$.</p> <p>With: $R = 1.534 + 0.5892(1) - 0.8719(4) - 0.0560(-2) = \mathbf{-1.254}$.</p> |

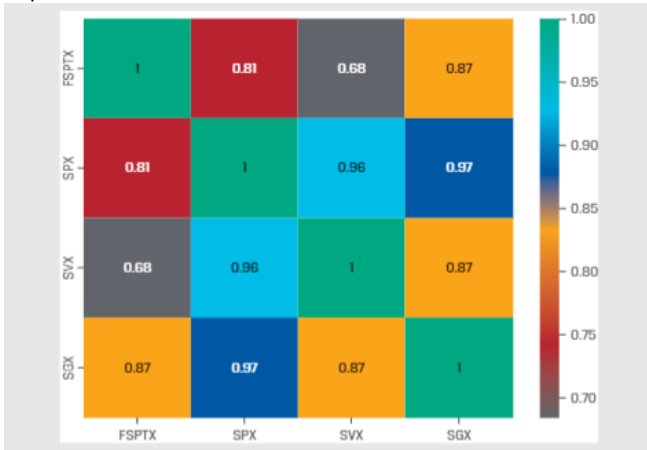

Evaluating Regression Model Fit and Interpreting Model Results

| Lesson | Location | PDF Pg | Revised | Correction |
|-----------------|-----------------------------|--------|----------------|--|
| Goodness of Fit | Paragraph below the bullets | 27 | 11 July 2024 | <p>Replace: Note that a t-statistic with an absolute value of 1.0 does not indicate the independent variable is different from zero at typical levels of significance, 5% and 1%.</p> <p>With: Note that a t-statistic with an absolute value of 1.0 does not indicate the coefficient of the independent variable is different from zero at typical levels of significance, 5% and 1%.</p> |
| Goodness of Fit | Exhibit 1 | 28 | 29 Jan 2024 | <p>Replace cell in column "Coefficient" and row "Intercept": 2.1876</p> <p>With: -2.1876</p> |
| Goodness of Fit | Text after Exhibit 2 | 29 | 20 August 2025 | <p>Replace: (Equation 3)</p> <p>With: (Equation 2)</p> |

| Lesson | Location | PDF Pg | Revised | Correction | |
|---|---|--------|----------------|--|---|
| Goodness of Fit | Knowledge Check - Solution to 1 | 31 | 29 Jan 2024 | Replace: The lower adjusted R^2 is consistent with the $ t\text{-statistic} $ for ADV's coefficient < 1.0 (i.e., 0.3302) and the coefficient not being different from zero at typical significance levels (P-value = 0.7429). | With: The lower adjusted R^2 is consistent with the $ t\text{-statistic} $ for ADV's coefficient < 1.0 (i.e., 0.3320) and the coefficient not being different from zero at typical significance levels (P-value = 0.7429). |
| Testing Joint Hypotheses for Coefficients | Equation with heading: One-sided coefficient test, right side | 34 | 29 Jan 2024 | Replace: $H_0: b_j \geq B_j, H_a: b_j > B_j$ | With: $H_0: b_j \leq B_j, H_a: b_j > B_j$ |
| Testing Joint Hypotheses for Coefficients | Step 5 in Question 2 in Knowledge Check | 40 | 22 August 2025 | Replace: $F = 54.4039$, as given in the regression output. (Note small difference vs. MSR/MSE from rounding.) | With: $F = 54.4029$, as given in the regression output. (Note small difference vs. MSR/MSE from rounding.) |

Model Misspecification

| Lesson | Location | PDF Pg | Revised | Correction | |
|---|--|--------|--------------|---|--|
| Violations of Regression Assumptions: Multicollinearity | Identifying Multicollinearity as a Problem | 68 | 26 July 2024 | Replace: This situation represents classic multicollinearity. We can visualize this in Panel B, with the correlogram representing the pairwise correlations between the variables. | With: This situation represents classic multicollinearity. We can visualize this in Panel B, with the correlation matrix representing the pairwise correlations between the variables. |

Extensions of Multiple Regression

| Lesson | Location | PDF Pg | Revised | Correction |
|---|--------------------|--------|--------------|--|
| Dummy Variables in a Multiple Linear Regression | Equation 3 | 87 | 29 Jan 2024 | <p>Replace:</p> $Y_i = b_0 + d_0 D_{b1} + b_1 X_i + \epsilon_i$ <p>With:</p> $Y_i = b_0 + d_0 D_{b1} + b_1 X_i + \epsilon_i$ |
| Dummy Variables in a Multiple Linear Regression | Exhibit 11 Panel C | 88 | 24 July 2024 | <p>Replace:</p> $Y = (b_0 + d_0) (d_1 + b_1) X$ <p>With:</p> $Y = (b_0 + d_0) + (d_1 + b_1) X$ |

| Lesson | Location | PDF Pg | Revised | Correction | |
|---|------------------------------------|--------|---------------|--|--|
| Dummy Variables in a Multiple Linear Regression | Equation 5 | 89 | 22 March 2024 | Replace: $Y_i = b_0 + d_0D_1 + b_1X_i + d_1D_iX_i + \varepsilon_i$. | With: $Y_i = b_0 + d_0D_1 + b_1X_i + d_1D_iX_i + \varepsilon_i$. |
| Dummy Variables in a Multiple Linear Regression | Question Set Question 3 | 93 | 29 Jan 2024 | Replace Option A: The average return for a regulated firm is 0.5% lower than for a non-regulated firm, holding the market share constant. | With: The average return for a regulated firm is at least 0.5% lower than for a non-regulated firm, holding the market share constant. |
| | | | | Replace Option C: For each increase in market share, a regulated firm has a 0.3 lower return on assets than a non-regulated firm. | With: For each increase in market share, a regulated firm will have an increasingly lower ROA than an unregulated firm. |
| Dummy Variables in a Multiple Linear Regression | Question Set - Solution to 3 | 93 | 29 Jan 2024 | Replace: A is correct because the coefficient on REG is -0.5 . | With: A is correct because the coefficient on REG is -0.5 . As MKTSH approaches 0, we see that the regulated firm has 0.5% less return. Or, if the Market Share Contribution to return is the same, that is, $0.2 \times \text{MKTSH}(\text{Regulated}) = 0.4 \times \text{MKTSH}(\text{Non-regulated})$, then the regulated firm has 0.5% less return. |
| | | | | C is correct because the sum of coefficients is $-0.3 = -0.5\text{REG} + 0.4\text{MKTSH} - 0.2\text{REG_MKTSH}$. | C is correct because the sum of coefficients is $-0.3 = -0.5\text{REG} + 0.4\text{MKTSH} - 0.2\text{REG_MKTSH}$. If MKTSH increases by 1%, for both regulated and non-regulated, the regulated firm will have a return that is 0.2% less, $0.2(1\%) - 0.4(1\%) = -0.2\%$. The 0.5% return of the non-regulated does not get included, since we are looking at the change in the return, based on a 1% increase in MKTSH. |
| Multiple Linear Regression with Qualitative Dependent Variables | Knowledge Check - Solution to 2 | 99 | 22 March 2024 | Replace: Therefore, the marginal impact of increasing the NPM variable by 1%, rounded to two decimal places, is a decrease in the probability of a share buyback of $29.00\% - 29.06\% = -0.07\%$; differently put, it increases the probability of a share buyback. | With: Therefore, the marginal impact of increasing the DE variable by 1%, rounded to two decimal places, is a decrease in the probability of a share buyback of $29.00\% - 29.06\% = -0.07\%$; differently put, it decreases the probability of a share buyback. |
| Solutions | Solution to 9 | 109 | 22 March 2024 | Replace: | With |

| Lesson | Location | PDF Pg | Revised | Correction |
|-----------|----------------|--------|---------------|--|
| | | | | $P = \frac{1}{1 + \exp \left\{ - \left[\frac{-2.0350 + (-0.7667)(0.2911) + (-0.0089)(92.9093) + (-0.1113)(2.3068) + (0.0292)(15.1743) + (0.0390)(2.0711) + (0.3432)(1.6060) + (-0.0502)(7.6489)}{1} \right] \right\}}$ |
| Solutions | Solution to 13 | 110 | 22 March 2024 | <p>Replace:</p> $\text{Probability of being a winning fund} = 0.3595 = \frac{1}{1 + \exp[-(-1.9589) + (0.3453)(4.0)]}$ <p>With:</p> $\text{Probability of being a winning fund} = 0.3595 = \frac{1}{1 + \exp[-(-1.9589) + (0.3453)(4.0)]}$ |

Time-Series Analysis

|---|----------------|----------------|----------------|--|--|--|----------------|-------------|-----------|--------|--------|--------|---|--|-------------|----------------|-------------|
| Detecting Serially Correlated Errors in an AR Model | Example 4 | 128 | 20 August 2025 | Replace: Analyst Melissa Jones decides to use a time-series model to predict Intel Corporation’s gross margin [(Sales – Cost of goods sold)/Sales] using quarterly data from the first quarter of 2003 through the second quarter of 2019. She does not know the best model for gross margin but believes that the current-period value will be related to the previous-period value. She decides to start out with a first-order autoregressive model, AR(1): Gross margin _t = b ₀ + b ₁ (Gross margin _{t–1}) + ε _t . Her observations on the dependent variable are 1Q 2003 through 2Q 2019. Exhibit 12 shows the results of estimating this AR(1) model, along with the autocorrelations of the residuals from that model. | | With: Analyst Melissa Jones decides to use a time-series model to predict Intel Corporation’s gross margin [(Sales – Cost of goods sold)/Sales] using quarterly data from the first quarter of 2003 through the first quarter of 2019. She does not know the best model for gross margin but believes that the current-period value will be related to the previous-period value. | Practice Problems/Solutions | Question 17 and Solution | 51, 59 | 24 July 2024 | <p>Remove the following Question 17: Compared to accounting principles currently in use, the pooling method BetterCare used for its Statewide Medical acquisition has <i>most</i> likely caused its reported:</p> <ul style="list-style-type: none"> A. revenue to be higher. B. total equity to be lower. C. total assets to be higher. <p>Remove the following Solution to 17: B is correct. Statewide Medical was accounted for under the pooling of interest method, which causes all of Statewide's assets and liabilities to be reported at historical book value. The excess of assets over liabilities generally is lower using the historical book value method than using the fair value method (this latter method must be used under currently required acquisition accounting). It would have no effect on revenue.</p> |
| Solutions | Solution to 27 | 61 | 24 July 2024 | <p>Replace: Investment in associate (Rainer) at the end of 2018</p> <p>With: Investment in associate (Rainer) at the end of 2016</p> |

Employee Compensation: Post-Employment and Share-Based

| | | | | <p>of \$1.52 if it distributed all earnings as dividends. Its required return of 6.8% and a current price of \$43.20 gives</p> $\$43.20 = (\$1.52/0.068) + PVGO$ $= \$22.42 + PVGO$ <p>and $PVGO = \\$43.20 - \\$22.42 = \\$20.78$. So, 48% ($\\$20.78/\\$43.20 = 0.48$) of the company's value, as reflected in the market price, is attributable to the value of growth.</p> | <p>of \$1.52 if it distributed all earnings as dividends. Its required return of 6.8% and a current price of \$43.20 gives</p> $\$43.20 = (\$1.52/0.068) + PVGO$ $= \mathbf{\$22.35} + PVGO$ <p>and $PVGO = \\$43.20 - \mathbf{\\$22.35} = \\$20.78$. So, 48% ($\\$20.78/\\$43.20 = 0.48$) of the company's value, as reflected in the market price, is attributable to the value of growth.</p> |
| The Gordon Growth Model: Other Issues | Example 11 | 301 | 4 November 2024 | <p>Replace:</p> <p>The justified leading P/E (based on next year's earnings) is</p> $\frac{P_0}{E_1} = \frac{1-b}{r-g} = \frac{0.5438}{0.056-0.0425} = 40.28.$ $\frac{P_0}{E_1} = \frac{1-b}{r-g} = \frac{0.5438}{0.056-0.0425} = 40.28$ | <p>With: (remove repeating equation)</p> <p>The justified leading P/E (based on next year's earnings) is</p> $\frac{P_0}{E_1} = \frac{1-b}{r-g} = \frac{0.5438}{0.056-0.0425} = 40.28.$ $\frac{P_0}{E_1} = \frac{1-b}{r-g} = \frac{0.5438}{0.056-0.0425} = 40.28$ |
